The Black Death 1346 - 1353. 14/08/2020. 02/10/2016 by Heather Y Wheeler. This timeline is a chronology of the spread of the Black Death that reached Europe in the mid 14th century killing around 50 million people - possibly as many as two thirds of the population. It was originally thought that the disease was spread by black rats, but due to the rate of spread and the lack of evidence of large numbers of rat corpses (Bubonic plague kills rats), it is now thought that the bacillus that ...

The Black Death, 1346–1353: The Complete History. By O LE J. B ENEDICTOW (Woodbridge: Boydell P., 2004; pp. xvi + 433. £30). T O call one's book 'the complete' history might be thought a hostage to fortune, but Professor Benedictow disarmingly points out that 'complete' is not the same as 'final'. This study is complete in the sense that it aspires to cover all of Europe, although inevitably the paucity of sources for some regions means that coverage is not uniform.

What Was the Black Death? | Live Science

Between 1347 and 1353 the Black Death, one of the deadliest pandemics in human history, killed thirty to sixty percent of Europe's population. For centuries the epidemic continued to strike every 10 years or so, its last major outbreak being the Great Plague of London from 1665 to 1666.

The Black Death Kills Thirty to Sixty Percent of Europe's ...

This synthesis of historical studies of the Black Death undertakes two tasks: to track the epidemic from its origin in the Golden Horde in 1346—not (as some have argued) in China in the 1330s—through its entry into Europe via Italy in late 1347, up to its departure via Russia in 1353; and to determine the percentage of the population that died in each region as a result.

It used to be thought that the Black Death originated in China, but new research shows that it began in the spring of 1346 in the steppe region, where a plague reservoir stretches from the north-western shores of the Caspian Sea into southern Russia. People occasionally contract plague there even today.

The Black Death: The Greatest Catastrophe Ever | History Today

The Black Death was an epidemic which spread across almost all of Europe in the years 1346-53. The plague killed over a third of the entire population. It has been described as the worst natural disaster in European history and is responsible for changing the course of that history to a great degree.

The Black Death: The Worst Event in European History

Benedictow certainly demonstrates, and so have many others, that bubonic plague was involved and could spread faster than we thought. On the other hand, he overgeneralizes local extreme kill rates, and he writes as if no other diseases were involved in the great death peak of 1346-1353.

So many sheep died from the Black Death that there was a European wool shortage. To avoid catching the disease, doctors rejected patients, priests declined to administer last rites, and shopkeepers shut their stores. The Black Death was not an airborne contagious disease and did not thrive during the winters, unlike many sicknesses.

New research, drawing on records from across Europe, throws light on the nature of the disease, its origin, spread, mortality, and its impact on history.

<div>Completely revised and updated for this new edition, Benedictow’s acclaimed study remains the definitive account of the Black Death and its impact on history. The first edition of The Black Death collected and analysed the many local studies on the disease published in a variety of languages and examined a range of scholarly papers. The medical and epidemiological characteristics of the disease, its geographical origin, its spread across Asia Minor, the Middle East, North Africa and Europe, and the mortality in the countries and regions for which there are satisfactory studies, are clearly presented and thoroughly discussed. The pattern, pace and seasonality of spread revealed through close scrutiny of these studies exactly reflect current medical work and standard studies on the epidemiology of bubonic plague. Benedictow’s findings made it clear that the true mortality rate was far higher than had been previously thought. In the light of those findings, the discussion in the last part of the book showing the Black Death as a turning point in history takes on a new significance. OLE J. BENEDICTOW is Professor of History at the University of Oslo.</div>

<div>If the twenty-first century seems an unlikely stage for the return of a 14th-century killer, the authors of Return of the Black Death argue that the plague, which vanquished half of Europe, has only lain dormant, waiting to emerge again—perhaps, in another form. At the heart of their chilling scenario is their contention that the plague was spread by direct human contact (not from rat fleas) and was, in fact, a virus perhaps similar to AIDS and Ebola. Noting the periodic occurrence of plagues throughout history, the authors predict its inevitable re-emergence sometime in the future, transformed by mass mobility and bioterrorism into an even more devastating killer.</div>

<div>*Includes pictures *Includes accounts of the plague written by survivors across Europe *Includes a bibliography for further reading "The trend of recent research is pointing to a figure more like 45-50% of the European population dying during a four-year period. There is a fair amount of geographic variation. In Mediterranean Europe, areas such as Italy, the south of France and Spain, where plague ran for about four years consecutively, it was probably closer to 75-80% of the population. In Germany and England ... it was probably closer to 20%.." - Philip Daileader, medieval historian If it is true that nothing succeeds like success, then it is equally true that nothing challenges like change. People have historically been creatures of habit and curiosity at the same time, two parts of the human condition that constantly conflict with each other. This has always been true, but at certain moments in history it has been abundantly true, especially during the mid-14th century, when a boon in exploration and travel came up against a fear of the unknown. Together, they both introduced the Black Death to Europe and led to mostly incorrect attempts to explain it. The Late Middle Ages had seen a rise in Western Europe's population in previous centuries, but these gains were almost entirely erased as the plague spread rapidly across all of Europe from 1346-1353. With a medieval understanding of medicine, diagnosis, and illness, nobody understood what caused Black Death or how to truly treat it. As a result, many religious people assumed it was divine retribution, while superstitious and suspicious citizens saw a nefarious human plot involved and persecuted certain minority groups among them. Though it is now widely believed that rats and fleas spread the disease by carrying the bubonic plague westward along well-established trade routes, and there are now vaccines to prevent the spread of the plague, the Black Death gruesomely killed upwards of 100 million people, with helpless chroniclers graphically describing the various stages of the disease. It took Europe decades for its population to bounce back, and similar plagues would affect various parts of the world for the next several centuries, but advances in medical technology have since allowed researchers to read various medieval accounts of the Black Death in order to understand the various strains of the disease. Furthermore, the social upheaval caused by the plague radically changed European societies, and some have noted that by the time the plague had passed, the Late Middle Ages would end with many of today's European nations firmly established. The Black Death: The History and Legacy of the Middle Ages’ Deadliest Plague chronicles the origins and spread of a plague that decimated Europe and may have wiped out over a third of the continent's population. Along with pictures and a bibliography, you will learn about the Black Death like never before, in no time at all.</div>

An ideal introduction and guide to the greatest natural disaster to ever curse humanity, replete with illustrations, biographical sketches, and primary documents. Presents medieval and modern perspectives of this disturbing yet fascinating tragic historical episode.

In this fresh approach to the history of the Black Death, John Hatcher, a world-renowned scholar of the Middle Ages, recreates everyday life in a mid-fourteenth century rural English village. By focusing on the experiences of ordinary villagers as they lived - and died - during the Black Death (1345 - 50 AD), Hatcher vividly places the reader directly into those tumultuous years and describes in fascinating detail the day-to-day existence of people struggling with the tragic effects of the plague. Dramatic scenes portray how contemporaries must have experienced and thought about the momentous events - and how they tried to make sense of it all.

A Rural Society after the Black Death is a study of rural social structure in the English county of Essex between 1350 and 1500. It seeks to understand how, in the population collapse after the Black Death (1348-1349), a particular economic environment affected ordinary people's lives in the areas of migration, marriage and employment, and also contributed to patterns of religious nonconformity, agrarian riots and unrest, and even rural housing. The period under scrutiny is often seen as a transitional era between 'medieval' and 'early-modern' England, but in the light of recent advances in English historical demography, this study suggests that there was more continuity than change in some critically important aspects of social structure in the region in question. Among the most important contributions of the book are its use of an unprecedentedly wide range of original manuscript records (estate and manorial records, taxation and criminal-court records, royal tenurial records, and the records of church courts, wills etc.) and its application of current quantitative and comparative demographic methods.
