Cell death is an essential process in development, and a  
major contributor to a wide range of human diseases. Three  
major classifications of cell death, apoptosis, autophagic cell  
death and necrosis, have been described for years, and the  
existence of many more forms of cell death is now accepted.  
In, *Necrosis: Methods and Protocols* experts in the field  
provide a wide range of methods and techniques for the study  
of necrosis in vitro and in vivo. These include methods and  
techniques for the analysis of necrosis in mammalian cells,  
characterization of alternative forms of cell death: entosis and  
pyroptosis, and analysis of cell death in non-mammalian  
model systems and mammalian tissues, including chapters on  
skin, brain, and heart. Written in the highly successful  
*Methods in Molecular Biology* series format, chapters include  
introductions to their respective topics, lists of the necessary  
materials and reagents, step-by-step, readily reproducible  
laboratory protocols, and key tips on troubleshooting and  
avoiding known pitfalls. Authoritative and practical, *Necrosis:*

This volume contains a unique selection of chapters covering a wealth of contemporary topics in this ubiquitous and diverse system of cell signaling. It offers much more than the accessibility and authority of a primary text book, exploring topics ranging from the fundamental aspects of calcium signaling to its varied clinical implications. It presents comprehensive discussion of cutting-edge research alongside detailed analysis of critical issues, at the same time as setting out testable hypotheses that point the way to future scientific endeavors. The contributions feature material on theoretical and methodological topics as well as related subjects including mathematical modeling and simulations. They examine calcium signaling in a host of contexts, from mammalian cells to bacteria, fruit fly and zebrafish. With much of interest to newcomers to the field as well as seasoned experts, this new publication is both wide-ranging and authoritative. The chapter "Calcium Signaling: From Basic to Bedside" is available open access under a Creative Commons Attribution 4.0 International License via [link.springer.com](http://link.springer.com).

This volume describes state-of-the-art protocols that serve as "recipes" for scientists concentrating on fibrosis research. This book is divided into four sections. Part I focuses on animal models of fibrosis and covers topics such as mimicking fibrosis in the lungs, skin, liver and heart, and generating transgenic mouse models. Part II discusses cell culture systems, where the chapters explore cell types important for the development of fibrosis. Part III looks at the purification, quantification, and analysis of the ECM proteins,

and Part IV describes computer-assisted methods such as quantifying fibrillar collagen alignment and exploring the nano-surface of collagen with atomic force microscopy (AFM). Written in the highly successful Methods in Molecular Biology series format, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step-by-step, readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls. Cutting-edge and practical, *Fibrosis: Methods and Protocols* is a valuable resource aimed at outstanding quality and repeatability of research experiments in the fibrosis field.
